

Submission – ERC0311 Access, pricing and incentive arrangements

My comments are as follows:

- a) State and Federal Governments have encouraged the transition to solar or enticed consumers to install solar.
- b) I am totally disagree with this change as it discriminates against all those people who undertaken the large cost to have solar installed.
- c) The government, when encouraging consumer to take up solar, why did not plan for upgrade to the network when they knew.
- d) There was no forward plan from any government to address this issue when solar was first embraced.
- e) Complete lack of planning by the government to address this.
- f) Governments have sold off the networks to private enterprise, why wasn't this money used to improve and expand the network.
- g) Those people who are trying to do the right thing are being penalised due to lack of planning by successive governments
- h) Typical lack of government policy on solar and renewables.
